

Structural Changes in Surface Layers of Technically-pure Iron (cont.)

SOV/137-58-12-25208

given of the structure of this zone and the H_V of its surface layers with different E. The following phases in the hardened layer were discovered by X-ray diffraction analysis: Fe α , Fe₄N, and austenite with an Fe E; cementite, Fe nitrides, austenite, and martensite with a graphite E; carbides of W and Ti, Fe nitrides, austenite, and martensite with a Ti₁₅K₆ E. Decomposition of nitrides and carbides with subsequent decrease of H_V was observed after tempering from 100 to 650°C and annealing at 750 and 850°. The formation of a hardened layer in electric-spark hardening is associated with the characteristic action of the spark discharge on the elements of the surrounding medium (air: 72% N₂ and - 28% O₂), as well as on the E material.

TITLE: The Influence of a Single Spark Discharge on the Structure of the
Surface Layers of Carbon Steels

PERIODICAL: Tr. kafedry "Tekhnol. metallov". Mosk. stankoinstrum. in-t, 1957,
No. 1, pp. 39-44

TEXT: Marks of single spark discharges were obtained on specimens of tempered steels 45, Y8 (U8), Y12 (U12) and hardened Y8 (U8) from electrodes of commercial Fe, graphite, and the hard alloy T15K6 (T15K6) at the voltage of 220 v, the capacitance of 200 microfarad, and the short-circuit current of 3 amp. A craterlike hole of 0.3-0.4-mm diameter emerges on the specimen surface at the point of spark discharge passing. The hole edges of tempered steel are surrounded by two concentric zones with an altered structure. The first zone is the zone of smelting and full hardening with martensite structure without excess phases, and the second zone is that with martensite structure and with a lattice of ferrite

The Influence of a Single Spark Discharge on the Structure of the Surface Layers of Carbon Steels

(steel 45) or cementite (U12). The microhardness of the martensite sections of the second zone amounts to 890-1,070 kg/mm². The hole on the hardened steel has, moreover, an external zone of tempering with a hardness of 710-840 kg/mm². The first zone at the graphite anode contains a considerable amount of residual austenite in connection with the saturation of the metal by carbon as well as by nitrogen from the air. At the hard alloy anode, sections of the hard alloy are discovered with the microhardness of 2,575-2,853 kg/mm² which are located near the hole edges. The nature of hardness changes at tempering the martensite sections around the holes obtained at the hard alloy anode, points out the saturation of the metal by tungsten and cobalt from the anode. The following picture of the action of spark discharges on the metal is suggested: During a short time after the formation of the spark discharge, a "microbath" of liquid metal exists on the specimen surface; the initial composition of the liquid does not differ from that of the specimen. This bath at the iron anode is saturated additionally by nitrogen from the air; at the graphite anode by carbon and nitrogen; at the hard alloy anode by the elements constituting the alloy composition. The heat

elimination into the specimen bulk makes the cooling rate exceeding the critical rate, and the solidified metal of the first zone, as well as the metal of the second zone adjacent to the first one, is hardened. There are 8 figures.

Nelmark, Yu. I., and Fufayev, N. A. On an error of V. Volterra in his derivation of the equations of motion of a nonholonomic system. Akad. Nauk SSSR. Pribl. Mat. Mekh. 15, 642-648 (1951). (Russian)

Volterra's equations,

$$d(\partial T/\partial p_i)/dt = \sum a_{ij}(\partial T/\partial p_j)p_j + T + P,$$

[Atti Accad. Sci. Torino Cl. Sci. Fis. Mat. N. 33, 451-475 (1898)] for nonholonomic systems, are correct but their derivation is based on the relation $d\delta x_i - \dot{x}_i dx_i = 0$ which, in general, does not hold for holonomic systems. [This error was made and noticed by many writers.] The major part of the paper deals with errors in a paper of V. V. Dobronravov [Uchenye Zapiski Moskov. Gos. Univ. Mechanika 122, tom II, 77-182 (1948); these Rev. 10, 630] who, from the same wrong relation, derived a wrong form of nonholonomic equations and a wrong generalization of the Hamilton-Jacobi theorem. These are disproved by means of examples. The authors seem to blame all this on Volterra.

AUTHORS: Neymark, Yu. J., Fufayev, N. A. (Gor'kiy)

TITLE: Permutable Relations in Analytical Mechanics of Nonholonomic Systems

PERIODICAL: Prikladnaya matematika i mekhanika, 1960, Vol. 24, No. 6,
pp. 1013-1017

TEXT: The authors investigate the question how far it is justified
to assume the correctness of the relation

$$(0.1) \quad d\delta q_{\tau} - \delta dq_{\tau} = 0,$$

where d is the differentiation with respect to the time and δ the
virtual variation, not only for holonomic but also for non-
holonomic systems. It is admissible according to Hamel and Volterra,
it is not admissible according to Levi-Civita, Amaldi and others.

The authors show that the discrepancy arises, since the operations
 $d\delta$ and δd occurring in (0.1) are not satisfactorily defined. In
the neighborhood of the considered path of motion $q_1 = q_1(t)$ the
authors introduce a curvilinear system $q_i = q_i(u_1, u_2, \dots, u_n)$ so
that $u_2 = u_3 = \dots = u_n = 0$ corresponds to the path, where $u_1 = t$

Card 1/4

88751

S/040/60/024/006/005/024
C 111/ C 333

Permutable Relations in Analytical Mechanics of Nonholonomic Systems

is on the path. The planes which touch the surfaces $u_{n+1} = \dots = u_n = 0$ in the points $u_2 = u_3 = \dots = u_n = 0$ are the planes of virtual displacements of the system. For linear and homogeneous kinematic bindings now it is defined:

$$(1.1) \quad dq_\tau = \frac{\partial q_\tau}{\partial u_1} du_1, \quad \delta q_\tau = \frac{\partial q_\tau}{\partial u_r} \delta u_r \quad (\tau = 1, \dots, m+k; \quad \checkmark \\ dq_\tau = a_{\tau s} dq_s, \quad \delta q_\tau = a_{\tau s} \delta q_s \quad (\tau = m+k+1, \dots, n; \quad r = 1, \dots, m; \quad s = 1, \dots, m),$$

where m is the number of the degrees of freedom, k fixed number ($0 \leq k \leq n-m$), where it is summed over double indices, and where $r, s, l = 1, \dots, m; i = 1, \dots, n; j = m+1, \dots, n; \quad \xi = m+1, \dots, m+k$
 $\alpha, \beta, \lambda, \mu, \nu = 1, \dots, m+k; \sigma = m+k+1, m+k+2, \dots, n$.

If for a nonholonomic system with the bindings

$$(1.2) \quad \dot{q}_j = a_{js} \dot{q}_s$$

Card 2/4

88751

S/040/60/024/006/005/024
C 111/ C 333

Permutable Relations in Analytical Mechanics of Nonholonomic Systems

there are introduced the quasicoordinates π_1, \dots, π_{m+k} by
 $(1.3) \dot{\pi}_r = a_{rs} \dot{q}_s, \quad \dot{\pi}_\theta = a_{\theta s} \dot{q}_s - q_\theta$

then one obtains the relations

$$(1.4) d\delta q_\lambda - \delta dq_\lambda = 0, \quad d\delta \pi_\lambda - \delta d\pi_\lambda = \gamma_{\lambda\mu} d\pi_\mu d\pi_\nu, \quad d\delta q_\epsilon - \delta q_\epsilon = B_{rs}^\epsilon d\dot{q}_r d\dot{q}_s$$

where

$$(1.5) \gamma_{\lambda\mu} = b_{\alpha\mu} b_{\beta\mu} \left(\frac{\partial a_{\lambda\alpha}}{\partial q_\beta} - \frac{\partial a_{\lambda\beta}}{\partial q_\alpha} \right), \quad b_{\alpha\lambda} a_{\lambda\beta} = \delta_{\alpha\beta} \quad (\text{Kronecker symbol}).$$

$$(1.6) B_{rs}^\epsilon = \frac{\partial a_{rs}}{\partial q_1}, \quad \frac{\partial a_{rs}}{\partial q_j} a_{jr} - \frac{\partial a_{sr}}{\partial q_s} - \frac{\partial a_{sr}}{\partial q_j} a_{js}$$

The two aspects mentioned above correspond to the cases $k = n - m$
and $k = 0$. X

Now the authors show that the equations of motion of a nonholonomic system can be written with the aid of (1.4) so that the equations

88751

TITLE: Chaplygin equations and the transfer multiplier theorem

PERIODICAL: Akademiya nauk SSR. Otdeleniye tekhnicheskikh nauk.
Prikladnaya matematika i mehanika, v. 25, no. 3,
1961, 385 - 390

TEXT: This is a continuation of an earlier work by S.A. Chaplygin
(Ref. 1: Odvishenii tyazhelogo tela vrashchenya na gorizontall'noy
ploskosti (On the Motion of a Heavy Solid of Revolution on a Hor-
izontal Plane) sobr. soch. Ti. izd-vo AN SSSR, L., 1933) and the
author derives the Chaplygin equations of motion for non-holonomic
systems in quasi-coordinates. The system is determined by n gene-
ralized coordinates $q_1 \dots q_n$ and possesses m degrees of freedom
($m < n$). Quasi-coordinates are defined by

$$\dot{q}_\alpha = a_{\alpha\beta} q_\beta \quad (\alpha, \beta = 1, \dots, m) \quad (1.1)$$

Card 1/4

Chaplygin equations and the ...

26724
S/040/61/025/003/001/026

where a double subscript denotes summation, quasi-velocities are given by

$$\dot{q}_i = b_{i\sigma} \dot{\pi}_\sigma \quad (i = 1, \dots, n; \sigma = 1, \dots, m) \quad (1.2)$$

and resulting Chaplygin's equations are

$$\frac{d}{dt} \frac{\partial L^*}{\partial \dot{q}_i} - \frac{\partial L^*}{\partial \pi_\alpha} + \frac{\partial L}{\partial q_i} \left(\frac{\partial b_{i\alpha}}{\partial \pi_\alpha} - \frac{\partial b_{i\alpha}}{\partial \pi_\sigma} \right) \dot{\pi}_\sigma = 0 \quad \begin{matrix} i = 1, 2, 3, \dots, n \\ \alpha, \beta, \sigma = 1, \dots, m \end{matrix} \quad (1.7)$$

where

$$L^*(q_\beta, \dot{\pi}_\sigma) = L(q_\beta, b_{i\sigma} \dot{\pi}_\sigma). \quad (1.5)$$

The method of integrating Chaplygin's equations is given by introducing new independent variable τ related to time t by

$$d\tau = N dt \quad (0.1)$$

where N = a determinable function of independent parameters, called by the author the "transfer multiplier". Here the theorem is de-

rived in terms of quasi-coordinates and the function N is found to be such as to satisfy simultaneously

$$\frac{1}{N} \frac{\partial N}{\partial \pi_1} = B_i \left(\frac{\partial b_{i2}}{\partial \pi_1} - \frac{\partial b_{i1}}{\partial \pi_2} \right), \quad \frac{1}{N} \frac{\partial N}{\partial \pi_2} = - A_i \left(\frac{\partial b_{i2}}{\partial \pi_1} - \frac{\partial b_{i1}}{\partial \pi_2} \right) \quad (2.9)$$

where

$$\frac{\partial b_{ia}}{\partial \pi_\beta} = \frac{\partial b_{ia}}{\partial q_\sigma} \frac{\partial q_\sigma}{\partial \pi_\beta} = \frac{\partial b_{ia}}{\partial q_\sigma} b_{\sigma\beta} \quad (i = 1, \dots, n) \quad (\alpha, \beta, \sigma = 1, 2)$$

A_i , B_i are known functions of q_1 and q_2 and given by

$$\frac{\partial L}{\partial q_1} = \frac{1}{N} (A_1 p_1 + A_2 p_2) \quad (2.8)$$

where

$$p_1 = \frac{\partial T^*}{\partial \pi_1} = N^2 (L_1 \pi_1' + M \pi_2'), \quad p_2 = \frac{\partial T^*}{\partial \pi_2} = N^2 (M \pi_1' + L_2 \pi_2') \quad (2.7)$$

and M is given by

Card 3/4

Chaplygin equations and the ...

26724
S/040/61/025/003/001/026
D203/D304

$$2T^* = L_1 \dot{\pi}_1^2 + 2M\dot{\pi}_1\dot{\pi}_2 + L_2 \dot{\pi}_2^2 = N^2(L_1 \pi_1'^2 + 2M\pi_1'\pi_2' + L_2 \pi_2'^2) = 2T^*$$

and

$$\dot{q}_i = b_{i1} \dot{\pi}_1 + b_{i2} \dot{\pi}_2 \quad (i = 1, \dots, n). \quad (2.1)$$

Next, the type of problems is considered for which quasi-coordinates can be introduced and it is shown that the problems have to satisfy the following conditions: 1) Number l of real coordinates on which coefficients of non-holonomic relations and Lagrangian function depend must be smaller than $m =$ degrees of freedom of the system. 2) Number k of quasi-coordinates which together with l real coordinates are chosen as free parameters cannot be greater than $m - l$. An example quoted by Chaplygin is solved by means of quasi-coordinates. There are 7 Soviet-bloc references.

ABSTRACT: The authors prove that the equations of motion of a system with a nonlinear nonholonomic relation, obtained by Gamel, do not describe its behavior if one considers that it is a limiting case of a nonholonomic system with linear relations. Apropos the possibility of realizing nonlinear nonholonomic relations, various works on this subject do not actually contain examples of systems with nonlinear ideal nonholonomic relations which are essentially different from the example of P. Appell given by him in 1911. This example was carefully studied by Gamel, who set up equations of motion for it, starting from the conventional definition of virtual perturbations for systems with nonlinear nonholonomic

Card 1/2

AUTHOR: Neymark, Yu. I. (Gor'kiy); Fufayev, N. A. (Gor'kiy) 10

TITLE: The stability of the states of equilibrium of nonholonomic systems 13

SOURCE: Prikladnaya matematika i mehanika, v. 29, no. 1, 1965, 46-53

TOPIC TAGS: stability criterion, oscillatory system, applied mathematics 16

ABSTRACT: The problem of the stability of the states of equilibrium of nonholonomic systems was discussed by E. T. Whittaker (1937), O. Bottema (1949), M. A. Ayzman and F. R. Gantmakher (1957), A. N. Obmorshev (1955), G. N. Knyazev (1963), and others. The methods proposed by them for the investigation of stability, however, do not agree even from the viewpoint of the nature of the null roots. A survey of these papers is given in the present work by the authors. It indicates not only the absence of a single unique approach to the problem of the stability of the states of equilibrium of nonholonomic systems, but also a number of contradictions in the method of investigation of the stability. As shown in the present work, a nonholonomic system possesses the property that its states of equilibrium cannot be isolated, but forms a manifold whose dimension is not less than the num-

Card 1/2

L 54607-65
ACCESSION NR: AP5006255

ber of nonholonomic constraints. This property is the determining condition for the presence of null roots in the characteristic equation. The authors formulate a theorem concerning the asymptotic stability of the manifold of the states of equilibrium. The discussion is illustrated by several examples: the motion of a solid body parallel to an inclined plane, and the motion of an axially symmetrical body bounded from below by a spherical surface which can roll without slippage in a spherical bowl of different radius. SOURCE: AN SSSR. Doklady, v. 160, no. 4, 1965, 781-784

TOPIC TAGS: nonholonomic system, equilibrium state, stability, characteristic equation

ABSTRACT: It is shown that a nonholonomic system has a singularity in that its equilibrium states cannot be isolated, but form a manifold the dimensionality of which is equal to the number of equations of nonholonomic constraints. This singularity gives rise to zero roots of the characteristic equation. A theorem is formulated concerning the asymptotic stability of the manifold of equilibrium states. The theory is illustrated by means of an example of an axially symmetric body, bounded from below by a spherical surface, which can rock without sliding in a spherical cup. This report was presented by A. Yu. Ishlinskii.

TITLE: On the problem of track stability of vehicles on pneumatic tires

SOURCE: AN SSSR. Doklady, v. 170, no. 3, 1966, 533-536

TOPIC TAGS: stability criterion, potential energy, kinetic energy, motor vehicle, aircraft tire

ABSTRACT: Using the various theorems first derived by M. V. Keldysh, an analysis is made of oscillations of a vehicle with pneumatic tires. The equations of motion for a vehicle with m-pneumatic tires are written for small departures from a straight line motion, along the OY-axis, with a constant speed V. The vibration of the tires (without slipping) is given by the two equations

$$\ddot{x}_i + \dot{\xi}_i + V\dot{\theta}_i + V\varphi_i = 0; \quad \ddot{\theta}_i + \dot{\varphi}_i - \alpha_i V \dot{\xi}_i + \beta_i V \varphi_i + \gamma_i V \chi_i = 0, \quad i = (1, 2, \dots, m),$$

and the kinetic energy of the system is given by

Card 1/2

UDC: 531

ACC NR: AP6032847

$$\frac{d}{dt} \frac{\partial T}{\partial q_j} - \frac{\partial T}{\partial q_j} = Q_j + \sum_{i=1}^m \left(\frac{\partial U}{\partial \xi_i} \frac{\partial \xi_i}{\partial q_j} - \frac{\partial U}{\partial \chi_i} \frac{\partial \chi_i}{\partial q_j} + \frac{\partial U}{\partial \varphi_i} \frac{\partial \varphi_i}{\partial q_j} \right) \\ (j = 1, 2, \dots, n).$$

These equations are then simplified by using the assumption of very large speed V. This leads to the result

$$\ddot{z}_i + \frac{1}{\beta_i} \dot{\theta}_i = - \frac{a_i}{\beta_i} V \xi_i + \frac{v_i}{\beta_i} V \chi_i - V \theta_{i+1}$$

Three more equations are derived by taking the derivative of the potential energy U, with respect to the three coordinates ξ_i , χ_i , φ_i . These equations are then designated as generalized lead-angle hypotheses. As an example, the vibration of an airplane chassis with three pneumatic wheels is discussed. This paper was presented by Academician A. Yu. Ishlinskii on 23 December 1965. Orig. art. has: 15 equations.

Cosmic beacons in navigation (Kosmicheskiye mayaki v navigatsii), Moscow,
Voyenizdat M-va obor. SSSR, 1964, 201 p. illus., biblio. 2,300 copies
printed.

TOPIC TAGS: navigation, guidance, artificial earth satellite, space
communication, satellite communication, navigation system Transit

PURPOSE AND COVERAGE: This book acquaints the reader with the principles of the use of artificial earth satellites for navigation! It considers the effectiveness of a satellite navigation system in determining location at sea, laws of motion and methods of predicting the position of satellites in space at the moment of observation. Methods of determining ship position from observations of earth satellites and possibilities of measuring navigational parameters are cited. The book describes the effect of the atmosphere and ionosphere on the accuracy of these parameters. A generalized presentation of a navigational system and its elements is given. The concluding chapter of the book acquaints the reader with the American satellite navigation system "Transit". The book

is written from materials of the foreign press and is intended for a broad audience interested in problems of navigation.

TABLE OF CONTENTS abridged

Foreword — 3	
Ch. I. Navigational earth satellites among other navigational resources — 7	
Ch. II. Regularities of the motion of navigation earth satellites and prediction of their location in space — 25	
Ch. III. Methods of determining ship position at sea using a navigation earth satellite — 66	
Ch. IV. Possibilities of measuring navigation parameters to determine ship position from an earth satellite — 95	
Ch. V. Effect of the atmosphere on the accuracy of navigation parameters obtained by radio — 119	
Ch. VI. Elements of a navigation system with artificial earth satellites — 134	
Ch. VII. The American navigation system "Transit" — 169	
Bibliography — 200

S/020/60/131/01/009/060AUTHOR: Fufayev, V.V.TITLE: On Dirichlet Problem for Regions Having Corners

PERIODICAL: Doklady Akademii nauk SSSR, 1960, Vol 131, Nr 1, pp 37-39 (USSR)

ABSTRACT: Let the boundary Γ of Ω be a smooth curve of the class $H^{r+2+1/p}_\infty$ of S.M. Nikol'skiy, the ends of which meet under an angle ω , such that there arises a corner. Finite pieces of Γ near the corner P_0 are assumed to be linear. Let the length of Γ be 1 and let it be counted from the corner.Theorem 1 : Let $r, \frac{r-1}{p}$ be non-integer positive numbers,U an harmonic function of x and y, $U \in W_p^{\bar{r}} H^\alpha(\Omega)$, $\bar{r} + \alpha = r$.Then $f(s) = U|_{\Gamma}$ has the properties 1.) $f(s) \in H_p^{r-1/p}([0,1])$ 2.) in the case $\omega = \frac{\pi}{j}$, $j = 1, 2, \dots$ it is $f^{(kj)}(+0) =$

X

Card 1/3

68800

On Dirichlet Problem for Regions Having Corners S/020/60/131/01/009/C60

$= (-1)^k f^{(kj)}(-0)$ for all $k = 0, 1, 2, \dots$, for which $k_j < \bar{\gamma}$,

where $\bar{\gamma} = \frac{r-1}{p} = \bar{\theta} + \beta$, $0 < \beta < 1$. If $\bar{\gamma} = m_j$ (m integer),
then it is moreover

$$\left(\int_0^h |f^{(mj)}(u) - (-1)^m f^{(mj)}(-u)|^p du \right)^{1/p} \leq ch^\beta$$

Theorem 2 is complete converse of theorem 1 in the case

$$\omega = \frac{\tilde{\pi}}{j}, \quad j = 1, 2, \dots$$

Theorem 3 shows that, if $\omega \neq \frac{\tilde{\pi}}{j}$, the converse (theorem 2) only holds in the case $r - \frac{2}{p} < \frac{\tilde{\pi}}{\omega}$.

The proofs are based on potentials of a double layer and on conformal mappings.

TITLE: Structural variation in alpha-uranium monocrystals deformed by stretching to the rupture point

SOURCE: Fizika metallov i metallovedeniye, v. 15, no. 6, 1963, 873-879

TOPIC TAGS: stretching effect, alpha-uranium, structural variation

ABSTRACT: The α -uranium monocrystals obtained by the phase transition $\beta \rightarrow \alpha$ and recrystallization in the α -phase were deformed by stretching at room temperature. X-ray photographs showed structural variations in monocrystals with respect to deformation degree. Small deformations caused extension of all the spots on the Laue diffraction patterns. Further stretching caused the disappearance of the Laue spots and the appearance of separate maxima of the characteristic radiation located irregularly on the Debye rings. Still further deformation caused an orderly arrangement of the maxima. The maximum deformation (close to the rupture point) produced the appearance of an axial texture with [001] axis.

Card 1/2

L 18048-63

ACCESSION NR: AP3002846

Because all the experiments showed only the texture with the $\langle 001 \rangle$ axis, it was assumed that plastic deformation of α -uranium at room temperature proceeds mainly by gliding along (010) - $\langle 100 \rangle$ and by twinning $\{130\}$ - $\langle 310 \rangle$. TITLE: The effect of temperature and neutron irradiation on plastic deformation of alpha uranium monocrystals 19

SOURCE: Atomnaya energiya, v. 19, no. 4, 1965, 372-380

TOPIC TAGS: radiation defect, radiation damage, neutron bombardment, uranium

ABSTRACT: The effect of temperature, crystal orientation, and neutron irradiation on the plastic deformation of alpha uranium monocrystals was investigated. The shape of the stress-strain curves of unirradiated samples was explained in terms of the plastic deformation modes. The effect of neutron irradiation on plastic deformation was investigated on 9 x 1.5 x 0.4-0.5 mm monocrystalline samples grown by β + α recrystallization. The samples were exposed to integrated fluxes (nvt) up to 10^{17} n/cm² and to 4×10^{20} n/cm² at temperatures not exceeding 100°C and subjected to tensile tests. X-rays and metallographic investigations have shown that exposure to nvt up to 1.6×10^{15} n/cm² does not change the plastic deformation mode. In crystals in which initial deformation occurred by slip along the plane (010) the yield point increased rapidly at small nvt, reaching saturation at 10^{17} n/cm². Irradiation caused a 3-5-fold increase in

Card 1/2

L 9558-66

ACC NR: AP5026444

the critical shear stress and decreased elongation from ~65% to ~40%. Annealing at 450C of crystals exposed up to 5.5×10^{17} n/cm² restored the mechanical properties of the samples. Orig. art. has: 14 figures. [CS]

ABSTRACT : The ureaformaldehyde resin was obtained by condensation of urea (in water solution with approx. 12% concentration) and formaldehyde in a molal ratio of 1:3. The condensation reaction was conducted at the boiling point in the course of 10 hours (pH of 6.2 - 6.5), then the resin was concentrated by evaporation at the residual pressure of 11 mm and 60° temperature. It is proposed to employ the obtained resin in place of the nitro-glue in the shoe industry. Stability of the glue resin is 2-3 weeks. --I. Pesin.

ABSTRACT : Description of experiments which show the
 possibility of utilizing sole-leather waste for making
 activated charcoal of standard quality. A finer grinding
 of the raw material increases the activity of finished
 product. To obtain charcoal of higher activity it is
 necessary to subject the raw material to a two-fold chemi-
 cal activation (with 30% solution of $ZnCl_2$) with a second
 activation with hot air. Preliminary defatting of the waste
 does not improve the quality of the charcoal. Optimal
 temperature and duration of carbonization, 750° and 6 hours
 temperature of second treatment with air, about 350° . In
 determining the activity the iodometric method can not be

TITLE: Observations concerning the plastic strain of ACD aluminium alloy for pistons

SOURCE: Metalurgia, no. 9, 1965, 478-480

TOPIC TAGS: aluminum base alloy, engine piston/ACD aluminum base alloy

ABSTRACT: The authors summarize the principal precautions that must be taken to assure the good quality of ACD aluminum alloy for pistons. The measures mentioned include accuracy and avoidance of casting interruptions during the preparation, reduction of friction coefficients during extrusion through the assurance of good tool surfaces, abiding by speed and time parameters, and homogenous heating. 1083. THE FORMATION AND CLOSURE OF A DEFECT IN THE INTERTRIAL
 SEPTUM (Russian text) - Fufin V. I. - EKSPER. KHM. 1956, 5 (17-24).
 The interatrial septum follows a complicated path of development in embryogeny, creating conditions for the formation of defects. The most common defect is failure of closure of the foramen ovale. The following operations are in use at the present time for closing septal defects: (1) Operation without opening the heart cavity. This is technically difficult. A reduction in the size of the atria takes place, with the danger of stenosis of the mouths of the vessels (invagination of the auricle). (2) Operations under digital control, the finger being inserted into the heart cavity. Two variations of this operation are described: using a plastic funnel (Gross, 1952) and atrioseptoplasty (Bailey, 1952). (3) Operations carried out either under direct vision with clamping of the venae cavae without or with hypothermia (Lukes and Taussig, 1952) and artificial circulation (Ellis, 1955). Total clamping of the venae cavae and the azygous vein shortens duration of the intra-cardiac operation. It carries, however, the danger of disturbance of the cerebral circulation and of air embolism; without hypothermia the veins may be clamped for a period of 2-3 min. Operations were performed on dogs at normal temperature with clamping of the veins. The operation lasted from 3-3.5 min. Of the 21 experimental animals, 11 survived the operation. (S)

TITLE: Stability of steady motions of holonomic and nonholonomic systems

SOURCE: Prikladnaya matematika i mekhanika, v. 30, no. 2, 1966, 236-242

TOPIC TAGS: motion stability, pendulum mechanics, coordinate system, perturbation,

ABSTRACT: It is shown that dynamic systems with a manifold of steady motions possess a number of singularities. Some results of a theoretical study are illustrated by an example of a plane pendulum. A system with incomplete dissipation of mechanical energy whose motion is described by

$$\frac{d}{dt} \frac{\partial L}{\partial q_j} + \sum_{i=1}^m h_{ij} q_i = \frac{\partial L}{\partial q_j}, \quad \frac{d}{dt} \frac{\partial L}{\partial \omega_k} = 0 \quad (j=1, 2, \dots, m) \\ (k=1, \dots, n-m)$$

is considered. In the case of holonomic as well as nonholonomic systems, the steady motions form a manifold of a certain dimensionality $q > 0$. In the case of a holonomic system, $q \geq n - m$. The singularities of the system are expressed by the presence

Orig Pub : Tr. In-ta vyssh. nerv. deyatel'nosti AN SSSR, ser. patofiziolog., 1956, 2, 34-45

Abstract : A fixed verbal reaction in an associative experiment (for instance: sky - blue) was altered (sky - clouded) in 42 students, age bracket 8, 12 and 16. The effects of the external inhibition led to increased latent period of the reaction without changes of its new property, or disinhibition of the earlier verbal connection,

Orig Pub : Ser. Patofiziolog., 1956, 2, 99-105

Abstract : The association experiment included definitions of direct stimuli of conditioned motor reactions (words like "red", "blue", etc). After the extinction of one of the responsive reactions light stimuli were applied. Children between 11 and 12 years of age showed either eclectic inhibition of the connection corresponding to the extinct verbal reaction, diffused extinction of motor
